Prototype	Cu ₅ FeS ₄
AFLOW prototype label	A7B_cF256_225_f2k_ce-001
Mineral name	bornite
ICSD	200424
CCDC	1705359
Pearson symbol	cF256
Space group number	225
Space group symbol	$Fm\bar{3}m$
AFLOW prototype command	<code>aflow --proto=A7B_cF256_225_f2k_ce-001</code> <code>--params=$a, x_2, x_3, x_4, z_4, x_5, z_5$</code>

- Bornite can take on several forms at different temperatures (Martinelli, 2018).
 - At temperatures above 508K it is cubic with an “anti”-fluorite ($C1$) structure.
 - From 443K to 508K it becomes a a supercell of an anti-fluorite structure (this structure).
 - Below 443K it becomes orthorhombic, in the $Pbca$ #61 space group.
 - As temperatures drop into the 50-70K range it transforms in to the non-centrosymmetric $Pca2_1$ #29 space group.
- In all of these cases the sulfur atoms form a face-centered or nearly face-centered cubic lattice.
- Data for this structure was taken at 458K. There is considerable disorder here. The site we labeled Cu-II is occupied 33% of the time with a mixture of copper and iron atoms. The Cu-I and Cu-III sites are occupied 31% and 7% of the time, respectively, and are purely copper. The sulfur atoms form a nearly cubic fcc lattice, with one of the tetrahedral sites is occupied by a copper or iron atom, and the other site is either filled by a copper atom or remains vacant. (Kanazawa, 1978)

Face-centered Cubic primitive vectors

$$\begin{aligned}
 \mathbf{a}_1 &= \frac{1}{2}a\hat{\mathbf{y}} + \frac{1}{2}a\hat{\mathbf{z}} \\
 \mathbf{a}_2 &= \frac{1}{2}a\hat{\mathbf{x}} + \frac{1}{2}a\hat{\mathbf{z}} \\
 \mathbf{a}_3 &= \frac{1}{2}a\hat{\mathbf{x}} + \frac{1}{2}a\hat{\mathbf{y}}
 \end{aligned}$$
